

Dahua Footage Retrieval on NVR

1. Right click and select the main menu then login to your system using the draw code or the password for the system.
2. Once you are in the main menu, click on the option on the top left hand corner which says "Search".

3. Once you have entered the playback menu, select the date on the calendar on the top right and then select which cameras you want to retrieve footage from, to do this, use the tick boxes below the calendar and tick the camera/s

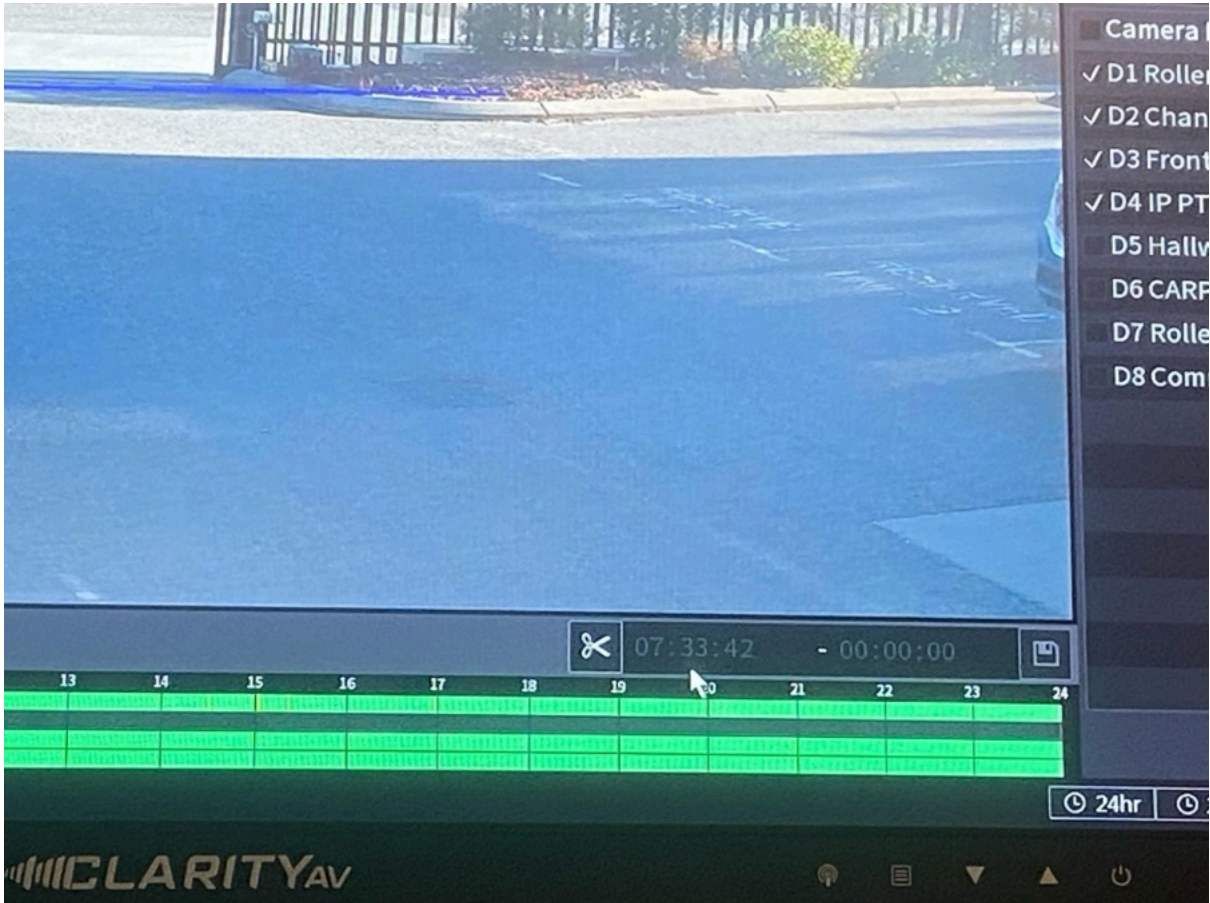

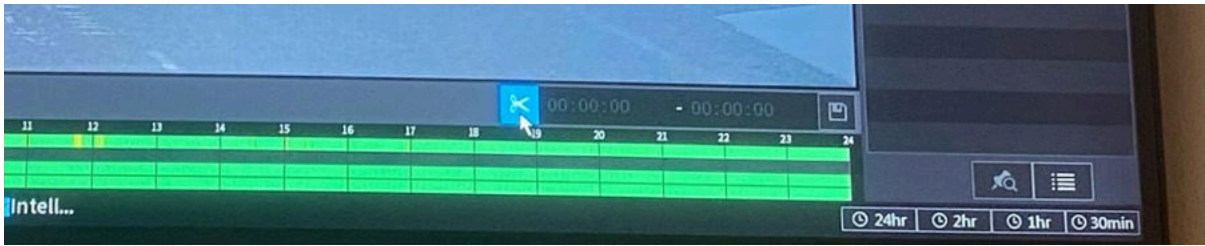

that you want to retrieve footage from.

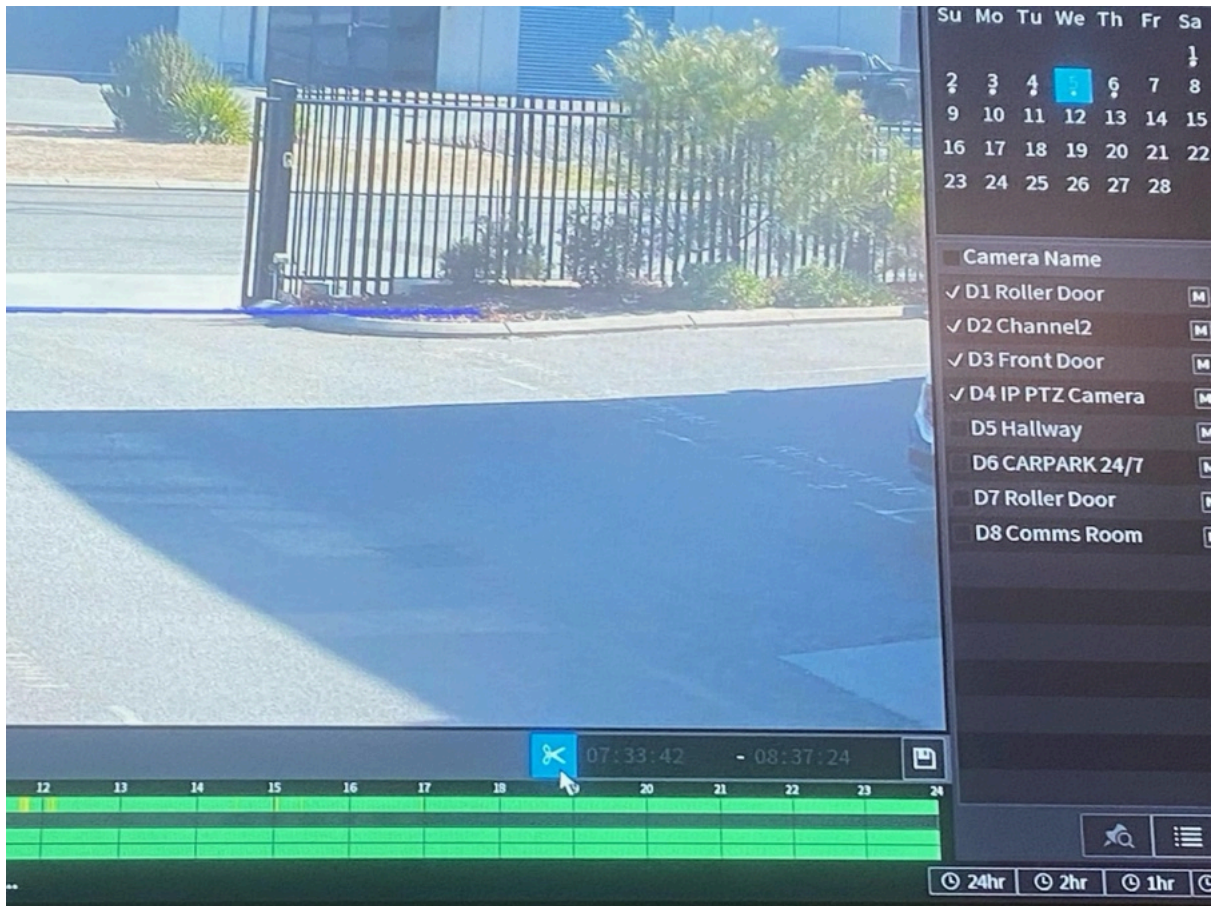

4. With the date and camera selected, now click on the timeline on the bottom of the screen to choose a start time for the footage. After clicking on the time, the recorded footage will begin to play. You can pause this by pressing the pause button on screen, at the left hand side just above the timeline.

5. To download the footage, first find the time when the incident occurred, then click on the scissors icon on the right hand side, just above the timeline. This will set a marker for where downloaded footage will begin.

6. Next, you can either let the footage play out until you capture what is needed, or you can click on the time when the incident ended and click on the scissors again, this will mark the ending of the footage that will be downloaded.

7. From there, it is as simple as plugging in a USB Thumb Drive, or an External Hard Drive, then clicking the save icon next to the scissors icon you have used to collect the footage.

- A new screen will appear asking you to select the USB device you are downloading the footage to, and then click on the backup button. This will begin downloading the footage to your USB device so you can take it to a computer or give the USB to whoever needs the footage. You have successfully saved footage from your NVR at this stage.
